

The wonder of water...

The water cycle is a process that is constantly recycling the Earth's supply of water. Humans, animals, and plants all need water to survive.

California Content Standard: Science Grade 3; Physical Sciences 1

Energy, matter, and evaporation are all part of the Earth's water cycle.

Water rises into the atmosphere, is cooled, condenses, and forms clouds.

Water is heated by the sun and evaporates from the Earth's surface.

The water that falls to the Earth runs off into lakes, rivers, streams, and any other body of water. ***This water should be litter-free.***
